FOR IMMEDIATE RELEASE

New Computer Air Filtering System Helps Protect Computers and Servers from Dust on the Inside

Charlottesville, VA – July 5th, 2005 – Filtalert Corporation introduces **PuraPC** (U.S. Patent No. 6,620,222), the newly released Computer Air Filtering System. **PuraPC** is a combination of scheduling software and a filtering system designed to help prevent dust and dirt from entering any PC or server. The dust that collects on your desk, keyboard and monitor on a daily basis also enters into your PC if unfiltered.

Dust and dirt trap heat in the computer's electronic components and clog the cooling fans, both of which will lead to overheating. Dust and dirt can even cause short circuits. Either scenario will lead to permanent system failure with loss of data and the possibility of fire from overheating.

PuraPC's software ensures that the filter(s) are checked regularly and are always air-permeable. It monitors the computer's "on" time automatically reminding the user when to service the filter(s).

The filters included in the **PuraPC** kit are easy to install and are made of polyurethane foam, which has minimal airflow restriction and catches most kinds of dust and dirt. The filters are installed over intakes instead of exhaust preventing trapping of heat inside the computer. **PuraPC** retails for less than \$15.
